

Supplemental Table S3 for: Erickson, Mount, Highland, Hockett, Hoff, Jenson, Norberg-King, and Peterson. “The acute toxicity of major ion salts to Ceriodaphnia dubia. III. Mathematical models for mixture toxicity”

Estimated total ion concentrations, ion activities, and osmolarities at 50% mortality in tests with field-based mixtures. For concentrations, normal text denotes nominal values when measurements indicated no significant precipitation of CaCO<sub>3</sub> or CaSO<sub>4</sub>, and bold red underlined text denotes values when measurements indicated precipitation, the measurements being used to estimate values at 50% mortality during the second day of the test for Ca, SO<sub>4</sub>, and alkalinity. Values for pH are averages of measurements at test termination, to nearest 0.05 pH unit. For the first F6 test, values are for highest tested concentration, at which there was no mortality.

Test ID	pH	Na Concentration mM	K Concentration mM	Ca Concentration mM	Mg Concentration mM	Cl Concentration mM	SO <sub>4</sub> Concentration mM	Alkalinity meq/L	Ca Activity mM
